Background

“ The Green Health Care help the leaders and managers of health care institutions, promoting the health of patients, visitors, employees, community members, and the global community, while operating economically and efficiently. Hope that every medical center, hospital and clinic in the nation gets a knowledge of the Green concept, takes its lessons to heart, and joins the growing movement toward healthier, more environmentally friendly environments in the health care sector. ”

(Howard Frumkin)

Green health care is likely to be most compelling because of its potential to protect and promote health, both directly and indirectly. These health benefits may operate on at least three scales: local, community, and global. On the local scale, within the walls of a hospital, research facility, or clinic, green construction and operation can protect patients, workers, and visitors.

Global warming has become the most important environmental issue due to its detrimental health effects. Institutional comprehension and involvement which may minimize its detrimental effects is considered insufficient. Based on recent data, there are lot of health care facilities in Indonesia which need the policy to apply the Green concept into management.

There is a large and growing body of evidence demonstrating the role of the physical environment in achieving healthcare quality and safety. For example, associations between the physical environment and patient and staff outcomes in four areas: reduced staff stress and fatigue and increased effectiveness in delivering care; improved patient safety; reduced patient stress and improved health outcomes; and improved overall healthcare quality.

Building green requires a big picture approach. At its core, planning and building green hospitals require that little harm be done to the macro- and micro-environments. This approach should be taken throughout the life cycle of the building and should include all support systems during its useful life. Healthcare facilities need to find the most important indicators for green hospital building. To establish a culture for green building, commitment must come from the top down.

The concept of Persahabatan Hospital as a Green Hospital is to expand green areas to enable oxygen and groundwater preservation for the surrounding society and living things. This is in accordance to the Persahabatan Hospital vision which is “To become the leading hospital in improving public health through world class respiration health services.”

Consequently, Persahabatan Hospital is planning a two days **Healthcare Seminar and Living Green Talkshow** presented by experts. We invited colleagues from Health Care Institution all over Indonesia to share with friends from Green Building Consultant. Hope that we can arrange together a green building concepts according to what Indonesian people need nowadays.

SCHEDULE

FRIDAY, FEBRUARY 20, 2009

- 07.30 – 08.00 Re-registration
- 08.00 – 08.10 Opening
